

ABSTRACT

Methods and apparatus for storing,
accessing, generating and using information about speed
5 limits and speed traps are described. The system
includes a positional sensor such as a GPS device.
Position information is used to access a database of
speed limit and/or speed trap information. The database
may be local or remote. Access to a remote database may
10 be achieved using a wireless communications device such
as a wireless (cellular) modem. Encountered speed traps
are logged in response to the activation of a speed trap
alert button by a user of the device or the output of a
radar/laser detector. Speed trap position, date and time
15 information is transmitted to the remote database system.
Speed limit information is used to control the speed of
the automobile as part of a cruise control operation
and/or is used to provide the motor vehicle operator with
warnings, e.g., that the applicable speed limit is being
20 exceeded. Speed trap information which is retrieved
using positional information provided by the GPS device
is used to warn the user of the device of speed traps in
the user's vicinity as the user approaches the location
of the known speed trap.
